THE NEW CRITICAL IDIOM
SERIES EDITOR: JOHN DRAKAKIS, UNIVERSITY OF STIRLING

The New Critical Idiom is an invaluable series of introductory guides to today's critical terminology. Each book:

- provides a handy, explanatory guide to the use (and abuse) of the term
- offers an original and distinctive overview by a leading literary and cultural critic
- relates the term to the larger field of cultural representation.

With a strong emphasis on clarity, lively debate and the widest possible breadth of examples, The New Critical Idiom is an indispensable approach to key topics in literary studies.

Also available in this series:

- Autobiography by Linda Anderson
- Class by Gary Day
- Colonialism/Postcolonialism by Ania Loomba
- Culture/Metaculture by Francis Mulhern
- Discourse by Sara Mills
- Dramatic Monologue by Glennis Byron
- Genders by David Glover and Cora Kaplan
- Gothic by Fred Botting
- Historicism by Paul Hamilton
- Humanism by Tony Davies
- Ideology by David Hawkes
- Interdisciplinarity by Joe Moran
- Intertextuality by Graham Allen
- Irony by Claire Colebrook
- Literature by Peter Widdowson
- Metre, Rhythm and Verse Form by Philip Hobsbaum
- Modernism by Peter Childs
- Myth by Laurence Coupe
- Narrative by Paul Cobley
- Parody by Simon Dentith
- Pastoral by Terry Gifford
- Realism by Pam Morris
- Romanticism by Aidan Day
- Science Fiction by Adam Roberts
- Sexuality by Joseph Bristow
- Stylistics by Richard Bradford
- Subjectivity by Donald E. Hall
- The Unconscious by Antony Easthope

ECOCRITICISM
Greg Garrard

Routledge

LONDON AND NEW YORK
NOTE ON TERMINOLOGY

While it is usual in academic writing to refer to 'Native Americans' rather than 'American Indians', I have used both terms interchangeably in this book. Neither is wholly satisfactory, and my understanding is that many Native Americans prefer the traditional term.

BEGINNINGS: POLLUTION

It is generally agreed that modern environmentalism begins with 'A Fable for Tomorrow', in Rachel Carson's *Silent Spring* (1962). Carson's fairy tale opens with the words, 'There was once a town in the heart of America where all life seemed to live in harmony with its surroundings' and, invoking the ancient tradition of the pastoral, goes on to paint a picture of 'prosperous farms', 'green fields', foxes barking in the hills, silent deer, ferns and wildflowers, 'countless birds' and trout lying in clear, cold streams, all delighted in by those who pass through the town (1999: 21). Concentrating on images of natural beauty and emphasising the 'harmony' of humanity and nature that 'once' existed, the fable at first presents us with a picture of essential changelessness, which human activity scarcely disturbs, and which the annual round of seasons only reinforces. However, pastoral peace rapidly gives way to catastrophic destruction:

Then a strange blight crept over the area and everything began to change. Some evil spell had settled on the community: mysterious maladies swept the flocks of chickens; the cattle and sheep sickened and died. Everywhere was a shadow of death.

In the ensuing paragraphs, every element of the rural idyll is torn apart by some agent of change, the mystery of which is emphasised by the use
of both natural and supernatural terminology of 'malady' and 'spell'. The most impassioned passage concerns the collapse in bird populations: 'On the mornings that had once throbbed with the dawn chorus of robins, catbirds, doves, jays, wrens, and scores of other bird voices there was now no sound; only silence lay over the fields and woods and marsh' (1999: 22). The 'silent spring' of the title alludes, on one level, to this loss of birdsong, although it also comes to function as a synecdoche for a more general environmental apocalypse.

So the founding text of modern environmentalism not only begins with a decidedly poetic parable, but also relies on the literary genres of pastoral and apocalypse, pre-existing ways of imagining the place of humans in nature that may be traced back to such sources as Genesis and Revelation, the first and last books of the Bible. Silent Spring initially suggests that the mythical eco-catastrophe of the fable might be supernatural, and emphasises this by including an epigram from Keats' poem 'La Belle Dame Sans Merci', in which the magical power of a beautiful woman blights the environment: 'The sedge is wither'd from the lake, / And no birds sing.' But then the fable concludes: 'No witchcraft, no enemy action had silenced the rebirth of new life in this stricken world. The people had done it themselves.' The rest of the book sets out to prove that such an apocalypse was already going on in a fragmentary way all over America, so that the doom befalling this mythical town of the future could be seen as a composite of lesser tragedies already known, and scientifically validated, in 1962.

The real culprits, according to Carson, were the new organic pesticides such as DDT, aldrin and dieldrin that had been introduced after the Second World War and had already proven highly successful in controlling pest insects. Silent Spring marshalled an impressive array of scientific evidence to show that this very success constituted a serious threat both to wildlife and to human health, confronting the utopian claims of agricultural scientists on their own ground. Carson's scientific claims have since been largely confirmed (although there is still no evidence that DDT is harmful to humans), leading to increased public awareness of pesticide pollution, firmer state regulation and development of less persistent agricultural chemicals.

Environmentalist claims like these make crucial contributions to modern politics and culture, and many of us respond to them to some degree, yet for the student of the humanities they can be difficult to assess on their own terms. Academia has been organised into relatively autonomous 'disciplines' and scientific problems seem to require scientific expertise. Nevertheless, the rhetorical strategies use of pastoral and apocalyptic imagery and literary allusions with which Carson shapes her scientific material may well be amenable to a more 'literary' or 'cultural' analysis. Such analysis is what we will call ecocriticism. This book is a critical introduction to the field of ecocriticism today.

Let us look, then, at some provisional definitions of the subject. The first is from the 'Introduction' to The Ecocriticism Reader (1996), an important anthology of American ecocriticism:

What then is ecocriticism? Simply put, ecocriticism is the study of the relationship between literature and the physical environment. Just as feminist criticism examines language and literature from a gender-conscious perspective, and Marxist criticism brings an awareness of modes of production and economic class to its reading of texts, ecocriticism takes an earth-centred approach to literary studies.

(Glotfelty 1996: xix)

Glotfelty goes on to specify some of the questions ecocritics ask, ranging from 'How is nature represented in this sonnet?' through 'How has the concept of wilderness changed over time?' to 'How is science itself open to literary analysis?' and finally 'What cross-fertilization is possible between literary studies and environmental discourse in related disciplines such as history, philosophy, psychology, art history, and ethics?'

Ecocriticism, then, is an avowedly political mode of analysis, as the comparison with feminism and Marxism suggests. Ecocritics generally tie their cultural analyses explicitly to a 'green' moral and political agenda. In this respect, ecocriticism is closely related to environmentally oriented developments in philosophy and political theory. Developing the insights of earlier critical movements, ecofeminists, social ecologists and environmental justice advocates seek a synthesis of environmental and social concerns.

It is worth noting also that the questions posed by ecocriticism in Glotfelty's account follow a clear trajectory: the first question, for example, is very narrow and literary, tending to favour the student of
Romantic verse. Thus, two of the most important works of ecocriticism in the 1990s were studies of Wordsworth and Shelley (Bate 1991 and Kroeger 1994). The questions grow in scope as the list continues, with several of the later ones suggesting gargantuan interdisciplinary studies such as Simon Schama’s *Landscape and Memory* (1995).

Richard Kerridge’s definition in the mainly British *Writing the Environment* (1998) suggests, like Glotfelter’s, a broad cultural ecocriticism:

> The ecocritic wants to track environmental ideas and representations wherever they appear, to see more clearly a debate which seems to be taking place, often part-concealed, in a great many cultural spaces.

Most of all, ecocriticism seeks to evaluate texts and ideas in terms of their coherence and usefulness as responses to environmental crisis.

(1998: 5)

We will have reason to question the monolithic conception of ‘environmental crisis’ implied here, and perhaps to resist the evaluation of ‘texts and ideas’ against a seemingly secure ecological yardstick: both as a science and as a socio-political movement, ‘ecology’ itself is shifting and contested. However, the emphasis on the moral and political orientation of the ecocritic and the broad specification of the field of study are essential.

From the point of view of academics, ecocriticism is dominated by the Association for the Study of Literature and the Environment (ASLE), a professional association that started in America but now has significant branches in the UK and Japan. It organises regular conferences and publishes a journal that includes literary analysis, creative writing and articles on environmental education and activism. Many early works of ecocriticism were characterised by an exclusive interest in Romantic poetry, wilderness narrative and nature writing, but in the last few years ASLE has turned towards a more general cultural ecocriticism, with studies of popular scientific writing, film, TV, art, architecture and other cultural artefacts such as theme parks, zoos and shopping malls. As ecocritics seek to offer a truly transformative discourse, enabling us to analyse and criticise the world in which we live, attention is increasingly given to the broad range of cultural processes and products in which, and through which, the complex negotiations of nature and culture take place.

Indeed, the widest definition of the subject of ecocriticism is the study of the relationship of the human and the non-human, throughout human cultural history and entailing critical analysis of the term ‘human’ itself. This book will reflect these trends by giving space to both literary and cultural ecocriticism. However, at this point there is a caveat: I will be dealing principally with British and North American literature and culture, although the principles of ecocriticism would of course admit of more general application.

Ecocriticism is unique amongst contemporary literary and cultural theories because of its close relationship with the science of ecology. Ecocritics may not be qualified to contribute to debates about problems in ecology, but they must nevertheless transgress disciplinary boundaries and develop their own ‘ecological literacy’ as far as possible. I therefore provide brief discussions of some important environmental threats faced by the world today. To consider these in detail is beyond the scope of this book, but it is essential for ecocritics to recognise that there are serious arguments about the existence of the problems, their extent, the nature of the threat and the possible solutions to them. So, for example, in Chapter 5, I consider the problem of ‘over-population’ from a demographic point of view, before going on to explain how the issue has been refracted through apocalyptic rhetoric.

It may seem obvious that ecological problems are scientific problems rather than objects of cultural analysis. Indeed, when *Silent Spring* was published the agro-chemical industry reacted by criticising the book for its literary qualities, which, they implied, could not coexist with the appropriate scientific rigour. Would we not be recapitulating the propaganda published by the pesticide producers if we read Carson’s book using literary-critical tools? John Passmore has proposed a distinction that may help to negotiate the problem. ‘Problems in ecology’, he maintains, are properly scientific issues, to be resolved by the formulation and testing of hypotheses in ecological experiments, while ‘ecological problems’ are ‘features of our society, arising out of our dealings with nature, from which we should like to free ourselves, and which we do not regard as inevitable consequences of what is good in that society’ (1974: 44). To describe something as an ecological problem is to make a normative claim about how we would wish things to be, and while this arises out of the claims of ecological scientists, it is not defined by them. A ‘weed’ is not a
kind of plant, only the wrong kind in the wrong place. Eliminating weeds is obviously a ‘problem in gardening’, but defining weeds in the first place requires a cultural, not horticultural, analysis. Likewise ‘pollution’ is an ecological problem because it does not name a substance or class of substances, but rather represents an implicit normative claim that too much of something is present in the environment, usually in the wrong place. Carson had to investigate a problem in ecology, with the help of wildlife biologists and environmental toxicologists, in order to show that DDT was present in the environment in amounts toxic to wildlife, but *Silent Spring* undertook cultural not scientific work when it strove to argue the moral case that it ought not to be. The great achievement of the book was to turn a (scientific) problem in ecology into a widely perceived ecological problem that was then contested politically, legally and in the media and popular culture. Thus ecocriticism cannot contribute much to debates about problems in ecology, but it can help to define, explore and even resolve ecological problems in this wider sense.

One ‘ecocritical’ way of reading is to see contributions to environmental debate as examples of rhetoric. I have already suggested that Carson deploys both pastoral imagery and apocalyptic rhetoric, and will return to these subjects, but there are many other applications of formal rhetorical analysis. For example, Ralph Lutts has attempted to account for the impact of *Silent Spring* by drawing attention to the underlying analogy Carson uses between pesticide pollution and another kind of pollution that was strong in popular consciousness in 1962:

She was sounding an alarm about a kind of pollution that was invisible to the senses; could be transported great distances, perhaps globally; could accumulate over time in body tissues; could produce chronic, as well as acute, poisoning; and could result in cancer, birth defects, and genetic mutations that may not become evident until years or decades after exposure. Government officials, she also argued, were not taking the steps necessary to control this pollution and protect the public. Chemical pesticides were not the only form of pollution fitting this description. Another form, far better known to the public at the time, was radioactive fallout. Pesticides could be understood as another form of fallout.

(2000:19)

So Carson combined ancient ways of imagining nature with contemporary ways of imagining a threat derived from ‘fallout hysteria’, with a view to establishing particular normative claims about pollution. Detailed rhetorical analysis shows how *Silent Spring* is constructed in order to achieve certain political results: not only the concrete measures described in the final chapter, but also a subtle revision of the concept of ‘pollution’ itself.

Reading *Silent Spring* as rhetoric has a number of advantages for an overtly politicised critical practice, some of which are set out by Marxist critic Terry Eagleton:

> What would be specific to the kind of study I have in mind . . . would be the kinds of effects which discourses produce, and how they produce them. Reading a zoology textbook to find out about giraffes is part of studying zoology, but reading it to see how its discourse is structured and organised, and examining what kind of effects these forms and devices produce in particular readers in actual situations, is a different kind of project. It is, in fact, probably the oldest form of literary criticism in the world, known as rhetoric.

(1996: 205)

I will be reading culture as rhetoric, although not in the strict sense understood by rhetoricians, but as the production, reproduction and transformation of large-scale metaphors. Each of my chapters will examine one such metaphor, thought to have specific – though sometimes ambivalent – political effects or to serve particular social interests. Some, like ‘pastoral’, are established literary tropes, whilst others name more heterogenous materials that one can provisionally unify under a single title. Since all are, in some sense, ways of imagining, constructing or presenting nature in a figure, I will call my chapter headings ‘tropes’. Each trope will gather together permutations of creative imagination: metaphor, genre, narrative, image. This introduction explores the trope of ‘pollution’ as an example. The basis upon which each trope is defined and limited is worked out in each chapter, with the constant proviso that, as ecocritics like to say, ‘the map is not the terrain’. My tropology is not definitive or exhaustive; it is intended to be enabling, not limiting.
Rhetorical analysis suggests that the meaning of tropes is closely related to their wider social context. They are therefore not fixed entities but develop and change historically. 'Pollution', for example, derives from the Latin 'polluere' meaning 'to defile', and its early English usage reflects its theologico-moral origins: until the seventeenth century it denoted moral contamination of a person, or acts (such as masturbation) thought to promote such contamination. This essentially interior or subjective definition was gradually transformed into an exterior or objective – in fact, specifically environmental – definition between the seventeenth and nineteenth centuries, to the point where today only its later definition is widely known. The process is exemplary in that it highlights how people had to learn to hate their detritus, as well as indicating the deep cultural roots of the fear attaching to such immoral emissions. Most of the tropes in the book are traced to ancient origins before I explore their modern inflection.

The first citation of the modern sense of 'pollution' in the *Oxford English Dictionary* is from Francis Bacon's *The Advancement of Learning* (1605), a founding text of modern scientific methodology: 'The Sunne . . . passeth through pollutions, and it selfe remaines as pure as before.' Bacon seems here to be writing about a material, not a moral, phenomenon, which constitutes a crucial shift in meaning, and the very birth of a new way of seeing and thinking. Yet a key text in ecocritical history, Carolyn Merchant's *The Death of Nature* (1980), ascribes to Bacon a pivotal role in the construction of an environmentally destructive world view where 'the image of an organic cosmos with a living female earth at its center gave way to a mechanistic world view in which nature was reconstituted as dead and passive, to be dominated and controlled by humans' (1990: xvi). Thus the trope of 'pollution' is historically implicated in both environmental destruction and salvation since Bacon both 'discovered' pollution in the modern sense and, according to Merchant, helped make much more of it. From an ecocritical perspective this reflects the ambivalent role of science as both a producer of environmental hazards and a critical analyst of them. All the tropes examined in this book show some such ambivalence.

Another crucial feature of rhetoric is that tropes are assumed to take part in wider social struggles between genders, classes and ethnic groups. Cultures are not shaped equally by all their participants, nor are the many world cultures equally powerful, and we must remain aware that even tropes that might potentially confront or subvert environmentally damaging practices may be appropriated. So although wilderness might seem to form a bulwark against an industrialised, materially progressive world view and social order, elements of that order such as manufacturers of four-wheel-drive Sports Utility Vehicles have still been able to appropriate the wild as the 'natural home' of their products in their advertisements (see Campbell 1998). Since these vehicles virtually require their own oil well to feed their huge engines, the irony of the juxtaposition might suggest to us that 'wilderness' has an ideological function in this case, helping to legitimise the conspicuous consumption of a privileged class and nation.

In ordinary usage, 'rhetoric' suggests language that substitutes for literal truth: it is all 'hot air'. The sense intended in this book, however, is emphatically interested in literal meaning. This would be a negligible point were there not important trends in literary and cultural theory that would seem to marginalise the role of literal truth in literature and culture, even in science itself. Structuralism and post-structuralism, for example, have emphasised the linguistic function of signs that relate to each other rather than refer to real things. Developments in other areas have reinforced this separation of language from reality; post-colonial and feminist literary theorists have shown that apparently real or 'natural' categories such as race and sex are better understood as 'cultural constructions' that covertly substitute normative claims about how, for example, women ought to be for how women actually or necessarily are. Feminist critics have distinguished between sex, which is a biological category, and gender, which is a social construction, and shown how a male-centred world view and social order have tried to legitimise changing gender constructions by referring them back to a supposedly fixed 'natural' sexual identity. 'Femininity' is not, according to many feminist theorists, a natural or necessary consequence of being genetically 'female', but rather a set of culturally prescribed behaviours. This argument largely or wholly detaches the female sex from a 'constructed' feminine gender identity that lives only in language and culture. Whilst this strategy provides opportunities for women to escape repressive stereotypes, it also represents a marked prioritisation of the claims of culture over those of nature.
‘Constructionism’ is a powerful tool for cultural analysis, and indeed, I have relied on it above in my discussion of the construction of ‘pollution’. But it does suggest that ‘nature’ is only ever a cover for the interests of some social group. The challenge for ecocritics is to keep one eye on the ways in which ‘nature’ is always in some ways culturally constructed, and the other on the fact that nature really exists, both the object and, albeit distantly, the origin of our discourse. Lawrence Buell calls this ‘a myth of mutual constructionism: of physical environment (both natural and human-built) shaping in some measure the cultures that in some measure continually refashion it’ (2001: 6). The imprecision of that phrase ‘in some measure’ is entirely necessary since such reciprocal ‘shaping’ networks of nature and culture are bound to be complex to the attentive eye. Throughout this book, the aim is to balance a constructionist perspective with the privileged claims to literal truth made by ecology. Ecocritics remain suspicious of the idea of science as wholly objective and value-free, but they are in the unusual position as cultural critics of having to defer, in the last analysis, to a scientific understanding of the world.

Buell’s phrase is certainly neat and useful, but part of the problem lies in the metaphor of ‘construction’ itself, which even in his revised version suggests an artefact like a building or machine, an autonomous work of minds and hands. I doubt many readers would automatically imagine a natural construction such as a termite mound. But if any building or machine, however technologically advanced, must be made by evolved animals (Homo sapiens) of materials of natural origin in accordance with natural ‘laws’ of mechanical physics, then it follows that all our vaunted cultural constructions are, in a sense, natural constructions. Perhaps the architectural metaphor obscures, or mystifies, the natural basis of all human culture and exalts only our own powers as a species. The excessively culturalistic implications of ‘construction’ are not easily avoided by a substitution of terms, but I tend to use ‘shaping’, ‘elaboration’ or ‘inflection’ to describe the complex transformations and negotiations between nature and culture, or between real and imagined versions of nature.

Returning to pollution with this in mind, we might observe that the rhetorical history of the term has been very closely aligned with the truth claims of ecologists and environmental toxicologists. Techniques of chemical analysis have developed to the point where unimaginably small amounts of chemicals can be detected in the environment:

In dealing with environmental reports or policies or regulations we must always keep in mind that what was zero today will no longer be zero tomorrow. We have already moved from measuring micrograms in the 1950s to measuring picograms in the 1980s and 1990s. . . . At the same time, we must keep in mind that there is no relationship between toxic effects and our ability to detect a chemical. Small amounts only matter if they do effect living organisms.

(Baarschers 1996: 46–7)

Baarschers is highly critical of environmentalist ‘hysteria’ surrounding the presence in the environment of amounts of chemicals far below levels of observable toxicity. His frustration at widespread misunderstanding and ignorance of environmental science is reasonable, given that people regularly accept the very high risks involved in, say, smoking, whilst demanding the elimination of infinitesimal risks associated with high-anxiety technologies. Environmental pressure groups may also promote ignorant paranoia rather than educated critique (see Chapter 5).

At the same time, Baarschers does not account for the possibility that public anxiety is a response to precisely the extent and degree of environmental surveillance that he describes. Rather than simply divorcing the ‘real risk’ as defined by toxicologists from the ‘perceived risk’ felt by the public, then criticising people for not trusting the experts, we ought to see perceived risk as, paradoxically, a consequence of increasingly sophisticated surveillance. The more accurately the expert measures hazards, the greater the disjunction between official estimates of risk and any conceivable lay assessment based on personal experience, a process of alienation sociologist Ulrich Beck describes as ‘expropriation of the senses’ (1999: 55). Furthermore, nuclear, biological and chemical ‘megahazards’ undermine the traditional guarantors of industrial safety such as private insurance, compensation and State regulation of measurable and calculable risks precisely insofar as the threat revealed by environmental surveillance dwindles below the point of statistical determinability. We cannot, by ourselves, assess risks, and industrial safety scientists actually render risks less knowable and more fearful the more they minimise them.
The result, Beck argues, is that security claims produced by mega-hazard industries themselves produce public insecurity. Carson's reconstruction of 'pollution' to include minute quantities of pesticides as well as the gross, observable pollution of traditional industrial production was the continuation of an historical process of redefinition that continues in contemporary culture. The proliferation of types and sources of 'pollution' means that artificial light and noise may now be considered pollutants and carbon dioxide defined as a climatological pollutant even though it occurs naturally in vast quantities. Baarschers's attempt to rationalise and minimise this continual extension cannot reckon with the political and media culture that Beck's constructionist analysis illuminates.

This generalisation and, from an ordinary sensory perspective, dematerialisation of pollution has significant ramifications in our culture, constituting a 'world risk society' of impalpable, ubiquitous material threats that are often in practice indissociable from their cultural elaborations. 'Pollution' has seeped into our culture in many areas and on various levels of representation, from the implicit environmental concern of Sylvia Plath's poetry (Brain 1998) to explicit environmental thrillers such as Hollywood 'green thriller' On Deadly Ground (1994) (Kerridge 2000; Ingram 2000). Buell has set out four criteria of such 'toxic discourse' as a cultural genre: a 'mythography of betrayed Edens' (2001: 37) based, like Carson’s parable above, in pastoral; horrified, 'totalizing images of a world without refuge from toxic penetration' (p. 38) founded most probably in the postwar fear of radioactive miasma from nuclear weapons; 'the threat of hegemonic oppression' (p. 41) from powerful corporations or governments as contrasted with threatened communities; and the 'gothicization' of squalor and pollution characteristic of the environmental expose. These criteria, and the genealogy of 'pollution' set out above, enable a vital modern ecocritical trope to be identified in slum gothic such as Dickens' Hard Times (1854), environmental lawsuit dramas like Erin Brockovich (2000), and the exploration of contamination of place and family in Terry Tempest Williams' Refuge (1991). Andrew Ross identifies New York as Hollywood's perfect toxic landscape: 'On the other side of authority lies a city teeming with biological perils. Surely no other city has had such a fantastic bestiary of historical residents – from alligators to ninja turtles – in its sewage tunnels' (1994: 135).

However, in the postmodern world of media saturation, the modern trope of 'pollution' can become dangerously separated from its referent in ways that Baarschers would not recognise. In Don DeLillo's White Noise (1986) the protagonist and narrator Jack Gladney strives to come to terms with the proximity of an unexpected 'toxic airborne event':

Smoke drifted from red beams of light into darkness and then into the breadth of scenic white floods. The men in Mylex suits moved with a lunar caution. Each step was the exercise of some anxiety not provided for by instinct. Fire and explosion were not the inherent dangers here. This death would penetrate, seep into the genes, show itself in bodies not yet born.

(1986: 116)

In one way this seems to confirm Beck's argument that the risk anxiety cannot be relieved or even addressed by 'instinct', the lack of definite threat itself making it all the more pervasive. Even so, the narrative struggles to characterise the 'event' in terms of other, pre-existing narratives, such as the 'conquest of space' with its spectacular imagery and military-industrial brand names. Pollution has become a spectacle that is almost detached from any real sense of threat thanks to the ubiquity of such images: 'the cloud resembled a national promotion for death, a multi-million dollar campaign backed by radio spots, heavy print and billboard, TV saturation' (p. 158). People living close to the emission rely on the media for its definition: at first, 'a feathery plume', then 'a black billowing cloud' and finally 'the airborne toxic event'. Reversing Baarschers's priority of fact over representation, the symptoms of victims change as the media risk reports are updated. The radical disproportion between saturation of imagery and paucity of fact marks the toxic event out as the kind of postmodern crisis with which ecocriticism must increasingly engage. Environmentalism and ecocriticism both rely on and produce exactly the sort of universalising truth claims or 'grand narratives' that postmodernists such as Jean Baudrillard regard as untenable. As historian Peter Coates argues:

According to universally disempowering postmodernist logic, the belief in the existence of a global environmental crisis is just another grand
narrative, for cultural theory insists that environmental threats (like everything else) are socially constructed and culturally defined: there are no shared, universal threats – different groups privilege those confronting their own particular interests.

(1998: 185–6)

Nevertheless, appeals to scientific truth claims as a counter to postmodernism are complicated by the fact that the science of ecology is itself undergoing transformation. Long-cherished notions of nature’s inherent harmony are challenged by postmodern ecology, as set out in Chapter 3. We need to distinguish between postmodernist theory, which is mainly inimical to ecocriticism, and postmodern ecology, which will increasingly become its scientific reference point.

So these are the basic propositions of this book: environmental problems require analysis in cultural as well as scientific terms, because they are the outcome of an interaction between ecological knowledge of nature and its cultural inflection. This will involve interdisciplinary scholarship that draws on literary and cultural theory, philosophy, sociology, psychology and environmental history, as well as ecology. The study of rhetoric supplies us with a model of a cultural reading practice tied to moral and political concerns, and one which is alert to both the real or literal and the figural or constructed interpretations of ‘nature’ and ‘the environment’. Breaking these monolithic concepts down into key structuring metaphors, or tropes, enables attention to be paid to the thematic, historical and geographical particularities of environmental discourse, and reveals that any environmental trope is susceptible to appropriation and deployment in the service of a variety of potentially conflicting interests. Ecocriticism makes it possible to analyse critically the tropes brought into play in environmental debate, and, more tentatively, to predict which will have a desired effect on a specific audience at a given historical juncture. To confront the vast, complex, multifarious agglomeration of ecological crises with the apparently flimsy tools of cultural analysis must be seen by the ecocritic as a moral and political necessity, even though the problems seem perpetually to dwarf the solutions.

The next chapter gives a brief account of the various political and philosophical orientations within the broad spectrum of environ-mentalism, in part to make clear that no single or simple perspective unites all ecocritics. From Chapter 3 onwards, the analysis is arranged under the names of important ecocritical tropes, starting with ‘Pastoral’, the most deeply entrenched, and concluding with the construction of the ‘Earth’ as a unified whole. Within each chapter, the development of the trope is traced historically and, in some cases, geographically, and I mix discussion of canonical texts and critics with more marginal materials in order to indicate the depth and breadth that the field has already assumed. The chapters follow a rough trajectory from traditional concerns with the local to contemporary concepts of the global: from place to space, from earth to Earth. Throughout the book I will return to the implications of postmodern ecology for ecocriticism.

Chapters 3 to 5 examine a linked series of tropes that are heavily indebted to the Euro-American Judaeo-Christian narrative of a fallen, exiled humanity seeking redemption, but fearing apocalyptic judgement – ‘Pastoral’, ‘Wilderness’, ‘Apocalypse’ – and assess the significance of the shapes these tropes have acquired in the modern world. Chapter 6 compares two quite distinct conceptions of ‘dwelling’ upon the Earth: the European ‘georgic’ tradition of writing about working on the land, and the more recent identification of indigenous ways of life as potential models for a harmonious existence. To discuss these constructions of humanity’s relationship with the natural world, however, takes for granted the problematic distinction between our species and other animals. Therefore Chapter 7 looks at the different ways in which animals, wild and domestic, are represented and conceptualised. I argue that reconsideration of the idea of ‘the human’ is a key task for ecocriticism, tending to drag it away from pastoral and nature writing towards postmodern concerns such as globalisation and ‘cyborg’ interfaces of humans with technology. In the final chapter, I explore the meanings that have clustered around the extraordinary images of the whole Earth from space, ranging from global marketplace to precious super-organism.
